

## **Project Initialization and Planning Phase**

| Date          | 7 July 2024  |  |
|---------------|--|--|
| Name          | Pratik Prasad Mahadik  |  |
| Project Title | Greenclassify: Deep Learning-Based Approach For Vegetable Image classification |  |
| Maximum Marks | 3 Marks  |  |

## **Project Proposal (Proposed Solution) template**

| <b>Project Overview</b>  |   |
|--------------------------|---|
| Objective                | To develop a Deep Learning-Based model for accurately classifying vegetable images into 15 categories.  |
| Scope                    | The project will focus on building a robust image classification model capable of identifying and distinguishing between different types of vegetables. The model will be trained and evaluated using a dataset of 21,000 images, with 15,000 images in the training set, 3,000 in the validation set, and 3,000 in testing respectively.                                     |
| Problem Statement        |   |
| Description              | The problem this project aims to address is the challenge of accurately and efficiently identifying different types of vegetables from images. The manual identification of vegetables can be a timeconsuming and subjective process, especially when dealing with a large variety of vegetable types or when the visual characteristics of different vegetables are similar. |
| Impact                   | Solving this problem will improve efficiency in various applications, such as inventory management in grocery stores, automated sorting in agriculture, and dietary analysis.   |
| <b>Proposed Solution</b> |   |

| Approach | <ol> <li>Collect and preprocess the dataset.</li> <li>Implement a CNN architecture suitable for image classification.</li> <li>Train the model on the training set, validate it on the validation set, and test its performance.</li> <li>Try different models such as VGG16, ResNet50, Inception,</li> </ol> |
|----------|---|
|----------|---|

|              | <ul><li>Xception. Compare their accuracy.</li><li>5. Fine-tune hyperparameters to improve accuracy.</li><li>6. Deploy the final model using Flask for real-time classification</li></ul>   |
|--------------|--|
| Key Features | <ol> <li>Use of CNN and transfer learning for high accuracy in image classification.</li> <li>Equal representation of all classes in the dataset to prevent bias. 3. Real-time model deployment using Flask with a user-friendly interface.</li> </ol> |

## **Resource Requirements**

| Resource Type           | Description                             | Specification/Allocation                                  |  |  |
|-------------------------|---|---|--|--|
| Hardware                |   |   |  |  |
| Computing Resources     | CPU/GPU specifications, number of cores | 1 X NVIDIA T4 GPU on<br>Google Colab                      |  |  |
| Memory                  | RAM specifications                      | 16 GB   |  |  |
| Storage                 | Disk space for data, models, and logs   | 1 TB SSD for data, model, and logs                        |  |  |
| Software                |   |   |  |  |
| Frameworks              | Python frameworks                       | TensorFlow, Keras, Flask                                  |  |  |
| Libraries               | Additional libraries                    | OpenCV for image processing, Matplotlib for visualization |  |  |
| Development Environment | IDE, version control                    | Google Colab Notebook, Git                                |  |  |

| Data |                      |   |
|------|----------------------|---|
|      |                      | Source: Kaggle dataset of 21,000 vegetable images |
| Data | Source, size, format | Size: 21,000 images                               |
|      |                      | Format: JPEG format, resolution 224x224 pixels    |
